

VALT · OWN THE MUSIC YOU LOVE

Milestone 3 — User Feedback & Updated Roadmap

Implementation & Prelaunch

Project: Valt — Superfan Experience Engine | **Project Catalyst:** Fund 11, Project #1100019

Milestone: 3 — Implementation & Prelaunch | **Live portal:** <https://www.valt.digital>

Prepared: 16 July 2026

1. Purpose & Criterion Mapping

This report is the evidence for the Milestone 3 Output *"Collect user feedback and make necessary improvements based on testing results"* and the Acceptance Criterion *"User feedback collected and analysed for further improvements"*. It also carries the **updated roadmap** required by the Evidence item *"Link to a document report of user feedback and updated roadmap"*.

2. Feedback Channels — What Exists

Valt collects signal through three channels, which differ in kind. Being precise about the difference matters, because two of them measure behaviour and only one captures opinion.

Channel	Captures	Status
Behavioural analytics — first-party instrumentation via the Awen client, live on valt.digital	What people <i>do</i> : page views, dwell time, read-completion, song play / pause / complete, wallet connections, NFT mints, registrations, outbound clicks	Live and collecting
Direct artist relationships — the launch partners who countersigned the Valt-inclusive terms in Milestone 2	What partners <i>think</i> : qualitative, attributable, high-context	Structured survey issued this milestone (\$4)
Contact form — [valt_contact_form] on the public site	Unprompted inbound: anything a visitor chooses to write	Delivers by email; not persisted (\$5)

Behavioural instrumentation — what is measured

The portal is instrumented first-party rather than through a third-party advertising tracker. The event vocabulary is deliberately narrow and Valt-specific — the platform records the moments that matter to a music-collectable product rather than a generic funnel:

page_view	time_on_page	content.read_complete	outbound.click
song_play	song_pause	song_complete	form_submitted
wallet_connected	nft_minted	purchase_completed	payment_failed
registration			

Two of those — **wallet_connected** and **nft_minted** — are the conversion steps this whole milestone exists to de-risk, and they are measured on the live portal today.

Privacy posture. Collection honours Do Not Track (no listeners are attached and nothing is sent), IP addresses are anonymised by default, and raw user-agent strings are reduced to device/browser/OS before leaving the site. Consent gating and an automatic retention policy are **not** yet in place; both are recorded as roadmap items in §6 rather than presented as solved.

Note for the milestone reviewer. This section describes the instrumentation that demonstrably exists and is verifiable from the live site. Event *volumes* are deliberately not quoted: the portal is a pre-production testnet deployment with a small invited audience, and citing traffic counts would imply a scale claim this milestone does not make. The behavioural data informs the roadmap; it is not offered as a substitute for the artists' own words.

3. The Gap We Found — and Why It Mattered

Reviewing the project honestly at the start of this milestone, we found something worth stating plainly: **Valt had extensive behavioural instrumentation and no way at all to capture an opinion.** There was no survey, no rating, no NPS, no free-text prompt — and the one form that existed emailed a single recipient and stored nothing. Analytics can show that a fan connected a wallet and abandoned before minting. It cannot say *why*.

That gap is the reason this milestone's feedback work is a structured instrument aimed at real, identified partners rather than an analytics screenshot. It also shapes the roadmap: Milestone 5 is titled "Closeout & **Evaluation**", and evaluation needs an instrument capable of producing evaluative evidence. Standing one up is therefore a prerequisite, not a nice-to-have.

4. Launch Partner Feedback Survey

The respondents are the artists who countersigned the Valt-inclusive Terms of Use on 10 July 2026 — the launch partners evidenced in the Milestone 2 Launch Partner Roster. They are the right population: they have committed to the platform, two are already live on-chain, and their answers carry accountability that anonymous responses do not.

Design notes

- **Mixed scale and free text.** Every rated question is paired with an open "why" prompt. A score tells us where to look; the sentence tells us what to change.
- **Questions about what they did, not what they'd like.** Asking an artist to speculate about features produces a wish list. Asking what actually happened when they used it produces a defect report.
- **Explicit permission to be negative.** Partners in a funded programme have an incentive to be encouraging. Q9 exists to make criticism the expected answer rather than an awkward one.
- **No leading language** about Cardano, NFTs or Web3 benefits.

Instrument

Q1. Onboarding. How straightforward was it to get your music onto Valt? (*1 = very difficult, 5 = very easy*) → **Q1b.** What was the most confusing or annoying part?

Q2. The artist dashboard. Did it show you what you needed? (*1–5*) → **Q2b.** What did you look for and fail to find?

Q3. Minting. If you have minted a song: did what happened match what you expected? (*1–5, or "haven't minted"*) → **Q3b.** If you have *not* minted — what stopped you? (This question is the one most likely to expose a real conversion blocker.)

Q4. The Valt (token-gated content). Is the idea of gating exclusive content behind song ownership something you would actually use with your fans? (*1–5*) → **Q4b.** What would you put in it — and what would you never put in it?

Q5. Explaining it to fans. How confident would you be explaining Valt to your audience? (*1–5*) → **Q5b.** Where does the explanation break down?

Q6. Wallets. Did you connect a Cardano wallet yourself? If so, how was it? If you did not, why not?

Q7. Revenue. The current split is 70/30 in the artist's favour. Setting aside whether you like the number — is it *clear* to you how and when you get paid? (*1–5*) → **Q7b.** What is unclear?

Q8. The one thing. If we could fix or build exactly one thing before public launch, what should it be?

Q9. Candid. What is the strongest reason a musician like you would *not* use Valt? Please be blunt — this is the most useful answer you can give us.

Q10. Recommendation. Would you recommend Valt to another independent artist today? (*Yes / Not yet / No*) →

Q10b. What would have to be true to change that answer?

Administration

Item	Detail
Population	The signed launch partners (5 accounts / 6 artist profiles) evidenced in the M2 Launch Partner Roster
Delivery	Direct to each partner, individually — not a broadcast
Attribution	Named, with the partner's knowledge. Published results are aggregated or quoted only with consent.
Personal data	Responses are retained privately by Awen. No email addresses, IPs or contact details appear in any public milestone document, consistent with the redaction practice established in Milestone 2.

Status at time of writing. The instrument above is finalised and issued. Responses are being collected; the analysis in §5 will be completed and this document reissued before the Milestone 3 Proof of Achievement is submitted. We have chosen to publish the instrument and its design rationale now rather than present an analysis of data we do not yet hold.

5. Analysis & Improvements Made

5.1 Improvements already driven by this milestone's testing

The Output reads *"Collect user feedback and make necessary improvements **based on testing results**".* The testing pass produced improvements independently of the survey, and those are already shipped — documented in full in the companion Test & Bug-Fix and Security Audit reports:

Improvement	Prompted by
The published open-source build can now be installed at all (it previously fatalled on activation)	Load testing of the graded artifact
Home-page song grid no longer depends on a function missing from the published build	Static analysis
Destructive admin actions now require a nonce (CSRF)	Manual security assessment
Artist dashboard output escaped (stored XSS)	Manual security assessment
Payment routes degrade to HTTP 501 instead of a fatal error	Static analysis
Plugin version reporting corrected, so browsers stop being served stale assets	Automated test

5.2 Survey analysis

To be completed on receipt of responses. This section will report, per question: the distribution of rated answers, the themes in the free-text responses, and — most importantly — which specific roadmap items in §6 were *added*, *reprioritised* or *dropped* as a direct result. Where a partner's answer contradicts our assumptions, that will be recorded rather than smoothed over: a survey that only confirms the existing plan has not been worth running.

6. Updated Roadmap

The roadmap honours the commitments made in earlier milestones and folds in this milestone's findings. Milestone 2 committed to mainnet launch *"following security review and QA"*, that review is now complete and its residual items appear below as explicit mainnet prerequisites.

6.1 Mainnet prerequisites

Each of these must be closed before mainnet, where real funds and real custody change the risk calculus. Sources are the Security Audit Report findings.

#	Item	Source	Target
1	Move NMKR API key and Pinata JWT to constant-only storage; mask the settings field	Finding 5.4	M4
2	Clamp <code>per_page / limit</code> ; add REST argument schemas	Finding 5.3	M4
3	Application-level rate limiting on public and point-earning routes	Finding 5.6	M4
4	Perimeter hardening: WAF, login throttling, vulnerability monitoring	Finding 5.6	M4
5	Independent third-party review of minting and gating before mainnet custody	Security Audit §7	M4

6.2 Engineering quality

Item	Rationale	Target
Automated tests and CI on every push	Delivered this milestone — the published build is now verified to load on every change	Done
Single-source the three code trees; document a release process	The root cause of this milestone's two critical defects was three divergent copies with no sync step	M4

Item	Rationale	Target
Behavioural integration tests for minting, wallet connect and gating	The current suite verifies structure and loading, not on-chain behaviour	M4
Decouple <code>valt-platform</code> from <code>valt-theme</code> (<code>valt_svg_*</code>)	The README describes them as decoupled; they are not. Pinned by a test so it cannot widen	M5

6.3 Product & standards

Item	Rationale	Target
CIP-60 music token metadata. Move minted songs from flat CIP-25 to the full CIP-60 v3 music-token standard, including on-IPFS audio	Makes Valt tokens legible to the wider Cardano music ecosystem — wallets, players and aggregators — rather than to Valt alone. Ecosystem interoperability is worth more to artists than a proprietary schema	M4
Persisted feedback capture. Store contact-form and in-product feedback in the database, not only in an inbox	\$3 — the platform can currently measure behaviour but cannot retain an opinion. M5 is "Evaluation" and needs an instrument	M4
Analytics consent gating and retention policy	\$2 — collection currently honours Do Not Track and anonymises IPs, but has no consent gate and no automatic purge	M4
Mainnet launch with the launch-partner roster	The Milestone 2 commitment, gated on \$6.1	M4
Community marketplace — buy / sell / trade of music collectables	Committed in the project README; requires mainnet and secondary-market design	M5
On-chain revenue sharing, royalty splits, governance tokens via Cardano smart contracts	The direction set out in the Valt Points whitepaper; beyond the Fund 11 scope but the intended destination	M5 +

6.4 Explicitly not planned

Recorded so the roadmap is a decision record rather than a wish list:

- **Gamification, leaderboards and campaigns are built but disabled by default.** They remain off until there is evidence that fans want them. Shipping engagement mechanics before anyone has asked for them would be building against our own assumptions rather than against feedback — Q8 and Q9 of the survey are designed partly to test this.
- **Third-party advertising trackers.** Instrumentation stays first-party.
