

VALT · OWN THE MUSIC YOU LOVE

Milestone 3 — User Feedback & Updated Roadmap

Implementation & Prelaunch

Project: Valt — Superfan Experience Engine | **Project Catalyst:** Fund 11, Project #1100019

Milestone: 3 — Implementation & Prelaunch | **Live portal:** <https://www.valt.digital>

Prepared: 16 July 2026 | **Updated:** 3 September 2026 (survey analysis added)

1. Purpose & Criterion Mapping

This report is the evidence for the Milestone 3 Output *"Collect user feedback and make necessary improvements based on testing results"* and the Acceptance Criterion *"User feedback collected and analysed for further improvements"*. It also carries the **updated roadmap** required by the Evidence item *"Link to a document report of user feedback and updated roadmap"*.

2. Feedback Channels — What Exists

Valt collects signal through three channels, which differ in kind. Being precise about the difference matters, because two of them measure behaviour and only one captures opinion.

Channel	Captures	Status
Behavioural analytics — first-party instrumentation via the Awen client, live on valt.digital	What people <i>do</i> : page views, dwell time, read-completion, song play / pause / complete, wallet connections, NFT mints, registrations, outbound clicks	Live and collecting
Direct artist relationships — the launch partners who countersigned the Valt-inclusive terms in Milestone 2	What partners <i>think</i> : qualitative, attributable, high-context	Structured survey issued this milestone (\$4)
In-product feedback survey — the <code>/feedback</code> page and the site-wide prompt, persisted to the database (built this milestone)	What visitors <i>think</i> , structured: NPS, what brought them, and three questions on the ownership model — captured anonymously and stored, not merely emailed	Live and collecting (\$4)
Contact form — <code>[valt_contact_form]</code> on the public site	Unprompted inbound: anything a visitor chooses to write	Delivers by email; not persisted (\$5)

Behavioural instrumentation — what is measured

The portal is instrumented first-party rather than through a third-party advertising tracker. The event vocabulary is deliberately narrow and Valt-specific — the platform records the moments that matter to a music-collectable product rather than a generic funnel:

<code>page_view</code>	<code>time_on_page</code>	<code>content.read_complete</code>	<code>outbound.click</code>
<code>song_play</code>	<code>song_pause</code>	<code>song_complete</code>	<code>form_submitted</code>

Two of those — `wallet_connected` and `nft_minted` — are the conversion steps this whole milestone exists to de-risk, and they are measured on the live portal today.

Privacy posture. Collection honours Do Not Track (no listeners are attached and nothing is sent), IP addresses are anonymised by default, and raw user-agent strings are reduced to device/browser/OS before leaving the site. Consent gating and an automatic retention policy are **not** yet in place; both are recorded as roadmap items in §6 rather than presented as solved.

Note for the milestone reviewer. This section describes the instrumentation that demonstrably exists and is verifiable from the live site. Event *volumes* are deliberately not quoted: the portal is a pre-production testnet deployment with a small invited audience, and citing traffic counts would imply a scale claim this milestone does not make. The behavioural data informs the roadmap; it is not offered as a substitute for the artists' own words.

3. The Gap We Found — and Why It Mattered

Reviewing the project honestly at the start of this milestone, we found something worth stating plainly: **Valt had extensive behavioural instrumentation and no way at all to capture an opinion.** There was no survey, no rating, no NPS, no free-text prompt — and the one form that existed emailed a single recipient and stored nothing. Analytics can show that a fan connected a wallet and abandoned before minting. It cannot say *why*.

That gap is why this milestone's feedback work is a real instrument rather than an analytics screenshot — and why Milestone 5 ("Closeout & Evaluation") needs one: standing it up is a prerequisite, not a nice-to-have.

4. Feedback Instruments

Valt collects opinion through two instruments: a short **in-product survey** that produces persisted, structured signal from the wider audience — the source of the analysis in §5 — and a deeper **launch-partner questionnaire** for high-context qualitative depth from the signed partners. The in-product survey is described first because it is where the reported data comes from.

4.1 The live in-product survey

The **in-product survey** was built and shipped this milestone. It is the instrument that produces persisted, structured signal from the wider audience — not only signed partners — and it is the source of the quantitative analysis in §5. It lives on the public `/feedback` page and as a site-wide prompt, and it writes every response to the database.

It is deliberately short — one screen, mostly one-tap — because response rate falls sharply with length and the audience is small. Its questions are:

- **NPS** — likelihood to recommend Valt (0–10).
- **What brought you to Valt?** — multi-select; the *"I'm an artist — publish my music"* option is what lets a response be segmented as artist-side or collector-side.
- **Three ownership-model questions** distilled from the fractional-ownership research: what matters most when you collect a song; how you feel about early fans sharing in a song's future earnings (1–5); and whether a future revenue share would make you collect more, the same, or less.
- **One free-text ask** — the single feature you would want — and how you found Valt.

Responses were gathered both directly (web submissions) and by distilling **1:1 conversations** with artists and collectors into the same instrument, so every voice is recorded on one comparable schema.

Scale and honesty note. This is a pre-production testnet with a small invited audience, so the sample is small by design. The analysis in §5 states **n** explicitly and reports counts and direction rather than percentages, which would imply a precision the sample size does not support. It is offered as directional qualitative signal, corroborated by the behavioural data in §2 — not as a statistical result.

4.2 Deeper launch-partner questionnaire

For high-context depth, a longer questionnaire was prepared for the signed launch partners — named, accountable answers that carry weight anonymous ones do not. It pairs every rated question with an open "why", asks what actually happened rather than what they'd wish for, and deliberately invites criticism ("the strongest reason *not* to use Valt"); responses are consented and held privately, with no PII in any public document. It gathers depth the one-screen survey cannot; the \$5 analysis comes from the in-product survey and the 1:1 conversations distilled into it.

5. Analysis & Improvements Made

5.1 Improvements already driven by this milestone's testing

The Output reads *"Collect user feedback and make necessary improvements **based on testing results**".* The testing and security passes produced improvements independently of the survey — the published plugin made installable, a missing home-page function restored, CSRF and stored-XSS fixes, the payment-path and version-reporting corrections, and the security-assessment remediations. These are shipped and documented in full in the companion **Test & Bug-Fix** and **Security Audit** reports, and are not re-listed here so this report stays focused on user feedback.

5.2 Survey analysis (n = 5)

Five responses have been collected and analysed: **three from artists** and **two from collectors**, the collector voices captured through 1:1 conversations. The sample is small and is treated as directional signal, but it is enough to surface one genuinely decisive finding and a short list of concrete asks.

Headline numbers

Measure	Result (n=5)	Reading
Net Promoter	+60 — three promoters, two passives, zero detractors	Broad goodwill; nobody who engaged came away negative
"Early fans sharing in a song's future earnings" (1–5)	Four rated it 5/5 ; one rated it 1/5	Loved by most — but not universal. See the finding below
"Would a future revenue share change how much you collect?"	Three more , two same , zero less	The model attracts or is neutral; it does not repel
How they found Valt	An artist ×2, Cardano community ×2, a friend ×1	Growth is entirely word-of-mouth and community — artist-led referral is the loop

Finding 1 — Fractional ownership is an artist-side draw and a divisive fan-side one

This is the answer the ownership-model questions were built to get, and it is more useful than a uniform yes. **All three artists** rated revenue-share 5/5 and chose *"the artist earning more"* as what matters most — an unambiguous artist-side YES. Among **collectors it splits**: the São Paulo collector loves it (5/5, would collect *more*, values *owning it for good*), while the Toronto collector is a clear skeptic — 1/5, would collect the *same*, and chose *unlocking exclusive content* over any financial upside: "I collect for the music, not returns."

Roadmap consequence: revenue-share / fractional features should be **opt-in and artist-configured, framed as a way to support an artist rather than as a fan investment**. Making them mandatory or speculative would alienate a real and valuable kind of collector while adding nothing for the artist-side enthusiasts, who are already sold. This directly reshapes the \$6.3 whitepaper items from "build the mechanic" to "build the mechanic as optional."

Finding 2 — The barriers named are access barriers, not disinterest

Nobody asked for the product to be different in kind; they asked for it to be *reachable*. The concrete asks, verbatim in intent:

Ask	From	What it really says
Mobile wallet support — "nobody I know uses a desktop extension"	Collector (São Paulo)	Desktop-extension wallets are a hard gate for much of the global audience
Local-currency pricing and a lower entry tier — "20 ADA is a real amount here"	Collector (São Paulo)	Price legibility and an affordable floor decide reach in emerging markets
Follow an artist + notify me on new drops	Collector (Toronto)	There is no retention loop today; interest has nowhere to go between releases
A shareable collector profile showing what I own	Collector (Toronto)	Collecting wants an identity and a way to be shown off — also a growth surface
Crowdfund a release + sell physical items	Artist	Maps to the whitepaper's fund-a-release mechanic and to merch fulfilment

Finding 3 — What contradicted our assumptions

Two things. First, we had inferred artist-vs-collector from a single use-case tick; the split on Finding 1 shows the segmentation is real and worth capturing **explicitly** — an added roadmap item. Second, the Toronto skeptic scores Valt a **9** on NPS *while* rejecting the ownership model — a reminder that the collectable and the music matter to people independently of any financial layer, and the product should not lead with the financial layer. A survey that only confirmed the plan would not have been worth running; this one changed how the ownership features will be shipped.

6. Updated Roadmap

The roadmap honours the commitments made in earlier milestones and folds in this milestone's findings. Milestone 2 committed to mainnet launch "*following security review and QA*"; that review is now complete and its residual items appear below as explicit mainnet prerequisites.

6.1 Mainnet prerequisites

Each of these must be closed before mainnet, where real funds and real custody change the risk calculus. Sources are the Security Audit Report findings.

#	Item	Source	Target
1	Move NMKR API key and Pinata JWT to constant-only storage; mask the settings field	Finding 5.4	M4
2	Clamp <code>per_page / limit</code> ; add REST argument schemas	Finding 5.3	M4
3	Application-level rate limiting on public and point-earning routes	Finding 5.6	M4
4	Perimeter hardening: WAF, login throttling, vulnerability monitoring	Finding 5.6	M4
5	Independent third-party review of minting and gating before mainnet custody	Security Audit §7	M4

6.2 Engineering quality

Item	Rationale	Target
Automated tests and CI on every push	Delivered this milestone — the published build is now verified to load on every change	Done
Single-source the three code trees; document a release process	The root cause of this milestone's two critical defects was three divergent copies with no sync step	M4
Behavioural integration tests for minting, wallet connect and gating	The current suite verifies structure and loading, not on-chain behaviour	M4
Decouple <code>valt-platform</code> from <code>valt-theme</code> (<code>valt_svg_*</code>)	The README describes them as decoupled; they are not. Pinned by a test so it cannot widen	M5

6.3 Product & standards

Item	Rationale	Target
In-product feedback survey (persisted). A structured NPS + ownership-model survey stored in the database	\$3 / \$4.1 — the platform could measure behaviour but not retain an opinion. Shipped this milestone; it is the source of the \$5.2 analysis	Done
Mobile wallet support. Support Cardano mobile wallets, not only desktop browser extensions	Feedback Finding 2 — "nobody I know uses a desktop extension." The single biggest access barrier for the global audience	M4
Local-currency price display and a lower entry tier	Feedback Finding 2 — "20 ADA is a real amount here." Price legibility and an affordable floor decide reach in emerging markets	M4
Follow an artist + new-drop notifications	Feedback Finding 2 — there is no retention loop today; a collector's interest has nowhere to go between releases	M4
Shareable collector / fan profile showing what someone owns	Feedback Finding 2 — collecting wants an identity; also an artist-led growth surface	M5
Explicit artist-vs-collector capture in the survey and account	Feedback Finding 3 — segmentation is currently inferred from one tick; the split on the ownership model shows it is real and worth capturing directly	M4
CIP-60 music token metadata. Move minted songs from flat CIP-25 to the full CIP-60 v3 music-token standard, including on-IPFS audio	Makes Valt tokens legible to the wider Cardano music ecosystem — wallets, players and aggregators — rather than to Valt alone. Ecosystem interoperability is worth more to artists than a proprietary schema	M4
Persist contact-form feedback to the database, not only an inbox	\$5 — the last unpersisted channel; closes out the "retain an opinion" gap begun by the in-product survey	M4
Analytics consent gating and retention policy	\$2 — collection currently honours Do Not Track and anonymises IPs, but has no consent gate and no automatic purge	M4
Mainnet launch with the launch-partner roster	The Milestone 2 commitment, gated on \$6.1	M4
Crowdfund a release + physical-item fulfilment	Feedback Finding 2 (artist ask) — maps to the whitepaper's fund-a-release mechanic and to merch	M5
Community marketplace — buy / sell / trade of music collectables	Committed in the project README; requires mainnet and secondary-market design	M5
On-chain revenue sharing — opt-in and artist-configured, royalty splits, governance tokens via Cardano smart contracts	The Valt Points whitepaper direction. Feedback Finding 1 reshapes it: make it optional and framed as artist support, not a mandatory fan-investment layer	M5 +

6.4 Explicitly not planned

Recorded so the roadmap is a decision record rather than a wish list:

- **Gamification, leaderboards and campaigns are built but disabled by default.** They remain off until there is evidence that fans want them. Shipping engagement mechanics before anyone has asked for them would be building against our own assumptions rather than against feedback — Q8 and Q9 of the survey are designed partly to test this.
- **Third-party advertising trackers.** Instrumentation stays first-party.
